Allgerd

Atmosphere: Breathable mix
Temperature: Cold
Biosphere: Human-miscible
Population: Hundreds of millions of inhabitants
Tech Level: TL4

The plant-like organisms on this planet are made up of trees and flowers, with only a few dozen of grass species, even less bush species and almost no brush and fungi species. Although the grass species are few in number, they grow fast and cover wide areas. The trees and flowers cover a lot more though and because they use up most of the nutrients, other species like shrubs and fungi haven't been able to reach higher numbers. Despite not being much more than the first baby steps to higher, more specialized species, the species on this planet already show great promise in terms of diversity and characteristics we've never seen before. While the surface of this planet has a decent variety of basic lifeforms, the water world has little more to offer beyond a large variety of algae. However, they come in so many different shapes and sizes, they may one day be the only type of plant-like organism in this planet's water world. While they don't grow in a large variety of colours, there's still something oddly beautiful about a huge field of grass-like algae or a forest of long, tentacle algae. Reptiles, amphibians and insects can be found all over this planet. One more beautiful than the next. Mammals are non-existent, but many of the reptiles do show early signs of taking the very first evolutionary steps into mammals. One can only wonder what they'll evolve into.
