Sha Savirit

Atmosphere: Thick atmosphere, breathable with a pressure mask
Temperature: Temperate
Biosphere: Human-miscible
Population: Several billion inhabitants
Tech Level: TL4

The plant-like organisms on this planet are made up of tall grasses and flowers, with even taller fungi and huge trees. Shrubs are non-existent and bushes are so rare they might as well be. While flowers come in more shapes and colours than grasses, they both share a wide variety of scents, most of which are related to the nutrients in their area. The fungi are tall, strong and, like the grasses and flowers, scented. The trees are also scented, but it's much harder to detect. Hidden among the countless of species lacking any form of advancement beyond their basic forms, are a few hidden gems beginning to show the first steps to more specialized species. The beginnings of thorns and specialized leaves can already be seen in a handful of species. Surprisingly, the underwater world of this planet has an abundance of primitive hard corals, but soft corals are extremely rare and only found in very specific regions. The hard corals are mostly nothing more than a shell with a flower-like organism growing out of it, which filters nutrients out of the ocean. But these hard corals already make for a gorgeous underwater world, despite them being all fairly similar to each other. Just like the dinosaurs ruled Earth, fish and insects rule this planet. They may be nowhere near the size of dinosaurs, the fish and insect species of this planet are numerous. Remarkably, no other type of animal can be found on this planet, with the exception of microbes of course. The fish and insects are all highly specialized works of evolution, but only time will tell if they will stay this way.
