Thorger

Atmosphere: Breatheable mix
Temperature: Variable cold-to-temperate
Biosphere: Human-miscible
Population: Hundreds of millions of inhabitants
Tech Level: TL3

Fauna & Flora

The plant-like organisms on this planet are almost all huge, towering trees, high above a layer of various shrubs, grasses and flowers. The trees can and often will completely block out light, which sometimes leads to a fairly empty ground layer, full of dead leaves. Organisms obviously don't want to be eaten and try to do everything they can to survive, but many species on this planet have turned the tables by eating animals and even each other. Some use trap systems to catch the animals, while others slowly grow around and strangle each other. But perhaps the most impressive killer is the species which kills its attackers. When an animal begins eating this species, it will retaliate by excreting small amounts of poison. If the animal eats enough of it, it will collapse where it stands, which, if it doesn't get dragged away by other animals, will give the soil around it more nutrients.

Aquatic plants are almost non-existent on this planet. Instead, life is limited almost exclusively to hard corals. Their rock-like skeletons offer a great deal of protection, but it's sometimes near impossible to tell where one coral starts and the other ends, let alone where coral meets rock. But their bright colours are bio-luminescent, which makes these depths come to life at night with an amazing spectacle of hundreds of differently coloured lights.

This planet is home to a huge variety of animals, mostly related to reptiles, birds and fish.
